The Steca Tarom MPPT solar charge controller sets new standards in the area of Maximum Power Point trackers. Outstanding efficiency along with unique safety features make it a universal top-grade charge controller.

There are two inputs that can be connected in parallel or used separately. Each input has its own MPP tracker. So there are two charge controllers available in one device. Different module arrays can be flexibly combined in one charge controller.

With an input voltage of up to 200 V, all kinds of solar modules can be used in various connection schemes. This charge controller combines high flexibility, maximum yields, professional battery care and an appealing design on the basis of advanced technology.

**Product features**
- Two independent maximum power point trackers (MPP trackers)
- Two inputs (connected in parallel or used separately for two different module arrays)
- Robust metal casing
- Comprehensive data logging of energy values for up to 20 years
- Data logger Micro-SD card for all minute values (6000-M only)
- Voltage and current regulation
- PWM control
- Temperature compensation
- Monthly maintenance charge
- Three configurable multifunctional contacts (6000-M only)
- Adjustable cut-off voltages
- Battery type: gel/liquid lead battery (for 6000-M also Li, NiCd and NiMh batteries)
- Integrated, automatic module switch
- 36 V and 60 V batteries can be charged with special settings in expert menu level

**Electronic protection functions**
- Overcharge protection
- Reverse polarity protection of module and battery
- Automatic electronic fuse
- Open circuit protection without battery
- Reverse current protection at night
- Overtemperature and overload protection
- PE connection

**Displays**
- Multifunction graphical LCD display with backlighting
- Configuration via display unit

**Interfaces for the Steca Tarom MPPT 6000-M**
- StecaLink Bus
- Open Steca RS232 interface
- Battery emergency off signal connection (optional, only for use with lithium-ion batteries)

**Options**
- External temperature sensor (included in the scope of delivery with the 6000-M)
- Connection for battery voltage sensor cable

**Certificates**
- Compliant with European Standards (CE)
- RoHS compliant
- Made in Germany
- Developed in Germany
- Manufactured according to ISO 9001 and ISO 14001

**Areas of application:**
- 3600 Wp
The Steca Tarom MPPT 6000-M is the first MPPT charge controller to also offer the option of charging lithium-ion batteries professionally using PV current. The latest research results in this area were used in its development, which took place in close cooperation with renowned, international research institutes. A self-developed charge strategy can be perfectly adapted to all available lithium chemistries using a wide range of parameters.

Using the innovative Steca Tarom MPPT 6000-M all alkaline batteries like NiCd or NiMh batteries can also be charged. A professional, configurable charging characteristic curve is available for this, which can be adapted to special battery and system prerequisites. Particularly with professional use, this charge strategy opens up entirely new possibilities.

**State of charge (SOC):**
The Steca Tarom MPPT 6000-M is equipped with a new type of highly-flexible algorithm for precise state of charge (SOC) calculation enabling automatic adaptation to battery and user behaviour. This enables the current state of charge to be assessed at any time.

**State of health (SOH):**
The Steca Tarom MPPT 6000-M incorporates an entirely new professional method of state of health (SOH) determination of the actual battery capacity. Following measurement, a statement can be formulated about how the battery is ageing.

This revolutionary new development provides advanced inspection options for user, operator and manufacturer – e.g. for SOH-based awarding of battery warranties.

**IUIa charging:** Depending on the type of battery and its state, the battery capacity can be increased by up to 20 percent by means of a constant current charge phase following full charging (IUIa charging). This function is now available for the first time for stand-alone PV systems too in the Steca Tarom MPPT 6000-M.

**Professional charging strategy for all lithium-ion batteries**

**Lead acid**

**Revolutionary innovative algorithms for lead batteries**

**Lithium**

**Professional charging strategy for all lithium-ion batteries**

**NiCd**

**Professional charging of NiCd batteries**

Save in the right places with Steca Tarom MPPT
With its innovative functions, the Steca Tarom MPPT not only offers greater efficiency, flexibility and comfort but also helps to avoid certain unnecessary costs that are incurred during the planning, implementation and ongoing operation of PV systems.

No need for additional devices!
... due to added flexibility as a result of the wide input voltage range
The Steca Tarom MPPT can be used with a wide input voltage range, which allows greater flexibility when selecting modules. The entire input voltage range of up to 200 V can be used for 12 V, 24 V and 48 V batteries.

... due to the two separate inputs
Two inputs each with independent MPP tracking in one charge controller provide greater options when it comes to system planning. With the Steca Tarom MPPT you can not only vary the module types for each input but the circuits too. Series and parallel circuits can be combined easily in one system using the universal and flexible Steca Tarom MPPT. There is no need for an external module circuit box as all module strings can be connected directly to the charge controller leading to significant savings on installation costs.

... due to two maximum power point trackers (MPPT)
The two separate maximum power point trackers enable various module types to be used with just one Steca Tarom MPPT charge controller. Leftover module stock can also be used in a system without any problems. Significantly greater options are also available when upgrading existing systems — without the extra cost of replacing an existing charge controller. The Steca Tarom MPPT is particularly suitable for systems where partial shading of the module array is unavoidable. Due to the two separate MPP trackers, the charge controller can power different strings with an individually adjusted MPP. This enables the maximum efficiency to be exploited for each string enhancing the total output of the system — in spite of partial shading. The same principle applies also for use on roofs or areas with various angles of inclination or orientations.

... due to the comprehensive, integrated data logger
The Steca Tarom MPPT is equipped with a unique, comprehensive data logger, which enables data of the two inputs to be monitored and saved independently over a period of twenty years. The previous 18 hours can be graphically displayed. Daily, monthly and annual totals are summarised automatically for an outstanding overview of system utilisation at a glance.

No need for additional modules!
... due to the extra high efficiency
The Steca Tarom MPPT is one of the few MPPT charge controllers that can reliably attain a high and — more importantly — constant efficiency across all input and output voltage ranges. The high level of reliability of the MPPT solar charge controller enables you to obtain even more power from your PV system. For example, significantly less energy is lost due to unnecessary heat losses. Conversely this means that, using the same power, as much as an entire module can be saved during planning if required. Particularly with limited mounting options or a limited budget this is an indisputable benefit.

Save time and effort during installation!
... due to the easily accessible, easy-to-connect terminals
The extra spacious connection terminal area can be accessed via two screws on the front of the device meaning installation of cables with a thickness of up to 35 mm² is simple, fast and secure. An integrated module switch means the Steca Tarom MPPT can be connected without any voltage connection, sparks or light arcs. Only when the charge controller is switched on via the menu are the module arrays connected up. This makes installation child’s play.

User-friendly graphical LCD display
All system states are displayed intuitively via icons on the graphical multifunction display enabling simple understanding of the energy flow. All parameters can be configured using the multi-lingual, intuitive menu.

Communication options
The PA HS400 current sensor can be connected via the StecaLink enabling all current flows in the system to be detected. The charge controller also shows the battery’s current state of charge (SOC). Professional control of loads and generators is possible via the multifunctional contacts.

The Steca Tarom MPPT 6000-M is equipped with three multifunctional contacts, which can be programmed independently of one another. These versatile individual functions can be combined virtually as required:

Function overview of multifunctional contacts:

Deep discharge protection
Deep discharge protection automatically protects the battery against harmfully low levels of discharge. All voltage thresholds can be freely configured via a menu based either on the battery’s current state of charge (SOC) or on the battery voltage.

Evening, night light and daylight function
The charge controller allows configuration of three different automatic timer functions: evening light, night light and daylight. All the important time and delay values can be set with this. With the evening light function, the load is automatically switched on at sunset and the time after which the load is switched off again can be individually specified. The night light function specifies the time after which the load is switched on after sunset and switched off again before sunrise. With the morning light function, the load is switched on automatically at night and automatically switched off again at sunrise.

Four freely programmable timers with week day function
The four freely programmable timers can be set individually based on day of the week, start and finish time. With the week day function, each timer can be used for just one or several days of the week at a time if required.

Generator function
Using the generator function, the Steca Tarom MPPT 6000-M – based on the SOC or the battery voltage – can start a generator automatically when the battery is discharged, and switch this off again when the battery is full. Using the surplus manager, an additional load can be activated automatically when the battery is full. This is switched off again as soon as no more energy surplus is available in the solar system. This guarantees that all available energy is used.
When is the use of an MPPT charge controller recommended?

There are essentially three situations where we recommend selecting an MPPT charge controller (Maximum Power Point Tracker) like the Steca Solarix MPPT or Tarom MPPT rather than a conventional PWM charge controller (Pulse Width Modulation) like the Steca Solsum, PRS, PR, Tarom or Power Tarom.

- **Situation 1**: 36 or 72-cell crystalline PV modules are not used
- **Situation 2**: Battery frequently low
- **Situation 3**: Low average temperatures and severe winters

For installations which are in operation throughout the year, it is important to maximise the energy yield in the months with the least sunlight. It is precisely here that the Steca MPPT charge controller can provide added value.

Which criteria need to be observed when configuring MPPT charge controllers?

In order to select the correct MPPT charge controller, the following data must be known: the input voltage of the PV modules ($V_{oc}$), the maximum power voltage ($V_{mpp}$), the total output of the PV modules (in Wp) and the battery voltage (12 V, 24 V or 48 V) and temperature coefficient ($V_{oc}$).

- **PV input voltage ($V_{oc}$)**: The open circuit voltage of the entire module array ($V_{oc}$) that occurs during the lowest possible ambient temperature must never exceed the MPPT charge controller’s maximum input voltage. If it does, this will destroy the charge controller.
- **Maximum power voltage ($V_{mpp}$)**: The maximum power voltage of the module string ($V_{mpp}$) must never fall below the minimum input voltage of the MPPT charge controller when the maximum ambient temperature occurs. The MPP voltage must be above the maximum battery voltage at all times – regardless of the temperature conditions and consequently at maximum ambient temperature too. For systems with a 12 V battery, this corresponds to an MPP voltage of at least 17 $V_{mpp}$; with use of a 24 V battery this will accordingly be at least 28 $V_{mpp}$ and in case of a 48 V battery at least 56 $V_{mpp}$.
- **Total output of the PV modules (Wp)**: The total output of the PV modules (in Wp) when connected should be less than or equal to the MPPT charge controller’s rated power. Although module arrays with higher powers can be connected up without the Steca MPPT charge controller being destroyed, the actual charge capacity will then be limited to the charge controller’s rated capacity. In practice, a module array that is oversized by up to 20 percent may be a good idea as the rate of efficiency will be. This is true for all MPPT charge controllers, regardless of which charge controller is used.
- **Note on efficiency**: The lower the voltage difference between the current PV input voltage and the battery voltage, the higher the MPPT tracker’s rate of efficiency will be. This is true for all MPPT charge controllers, regardless of the manufacturer.
- **Battery voltage**: The battery voltage is selected depending on the power of the consumers. It is generally a good idea to select a battery voltage that is as high as possible to keep the current low and hence save costs.

Overview of Steca MPPT charge controller rated output.
EXAMPLE CONFIGURATION OF AN MPP TRACKER

**Input voltage, calculation of maximum string length**

\[
\text{Modules} \leq \frac{U_{\text{nom, charge controller}}}{U_{\text{nom, modules}} \left(1 + \frac{\beta_{\text{Voc}} \cdot (T_{\text{ambient max}} - T_{\text{STC}})}{1 + \frac{\beta_{\text{Voc}} \cdot (T_{\text{ambient min}} - T_{\text{STC}})}{100}}\right)}
\]

**Minimum MPP voltage**

\[
\text{Modules} \geq \frac{U_{\text{nom, charge controller}}}{U_{\text{min, modules}} \left(1 + \frac{\beta_{\text{Voc}} \cdot (T_{\text{ambient max}} - T_{\text{STC}})}{1 + \frac{\beta_{\text{Voc}} \cdot (T_{\text{ambient min}} - T_{\text{STC}})}{100}}\right)}
\]

**Total output**

\[
\text{Modules} \leq \frac{P_{\text{nom, charge controller}} \cdot (1 + \text{DimFactor})}{P_{\text{max}, \text{mpp, modules}}} = \frac{250 \text{ Wp}}{37.6 \text{ V} \times 8.0 \text{ A}} \leq 16.56
\]

**Input voltage, calculation of maximum string length**

A maximum of 4 modules can be connected in series:

\[
\text{Modules} \leq \frac{200 \text{ V}}{37.6 \text{ V} \left(1 + \frac{0.3 \cdot 100}{-30 \degree C - 25 \degree C}\right)} \leq 4.56
\]

**Minimum MPP voltage**

At least 3 modules have to be connected in series:

\[
\text{Modules} \geq \frac{56 \text{ V}}{31.2 \text{ V} \left(1 + \frac{0.3 \cdot 100}{90 \degree C - 25 \degree C}\right)} \geq 2.23
\]

**Total output**

A maximum of 16 solar modules can therefore be used with the charge controller:

\[
\text{Modules} \leq \frac{3,600 \text{ W} \times 1.15}{250 \text{ Wp}} \leq 16.56
\]

To illustrate this better, a concrete example with certain conditions will have to be connected in parallel.

- **Charge controller:** Steca Tarom MPPT 6000
- **Rated power by 48 V:** 3,600 W
- **Rated solar module power at STC:** 250 Wp
- **Overdimensioning factor:** 15 %
- **Temperature range:** -30 °C bis +90 °C
- **Open circuit voltage Uoc:** 37.6 V
- **Minimum MPP voltage of solar modules:** 56 V
- **Temperature coefficient of open circuit voltage:** -0.3 % / K

The specifications for the module and charge controller requirements result in the following criteria:

**Battery:** 48 V

- **Minimum MPP voltage of solar modules:** 56 V
- **Rated power by 48 V:** 3,600 W

**Boundary conditions:**

- **Temperature range:** -30 °C bis +90 °C
- **Overdimensioning of solar modules:** 15%
