

BSM-125KTL

Modularity Inverter

Performance Features

- Wide DC voltage input range, max. voltage up to 1000V
- New inverter technology design, output harmonic wave is small, max. efficiency is up to 98.5%
- Sustainable operation under the environment temperature of 40°C operate with the power of 110%
- Wide MPPT tracking range and high efficiency MPPT
- Installation indoors
- Low voltage ride through
- Adjustable reactive power

- Active power derating
- Thin-film capacitor design improve the system service life
- Modularity design, easy for expansion and maintenance
- Having night SVG function, response the grid modulation command all weather

Brief Introduction

Modularity inverter can realize the paralleled operation of 1-8 independent 125KW inverter module units. The whole set of equipment shares one set of control unit in order to save costs. The new inversion technology design decreases the loss and improves the whole efficiency. Independent inverter module can start in turn, through starting the optimum number of inverter modules, the working time of inverter module can be balanced so as to effectively lengthen the service life of the whole set of equipment. Independent inverter module can be safely cut off through load switch, there is no need to shut down all the machines to maintain and replace the independent module, so it won't influence the operation of other modules. Humanized touch screen operation interface can be maintained without shut down. Remote monitoring system is adopted to check and modify the system setups, easy to maintain and fast to response.

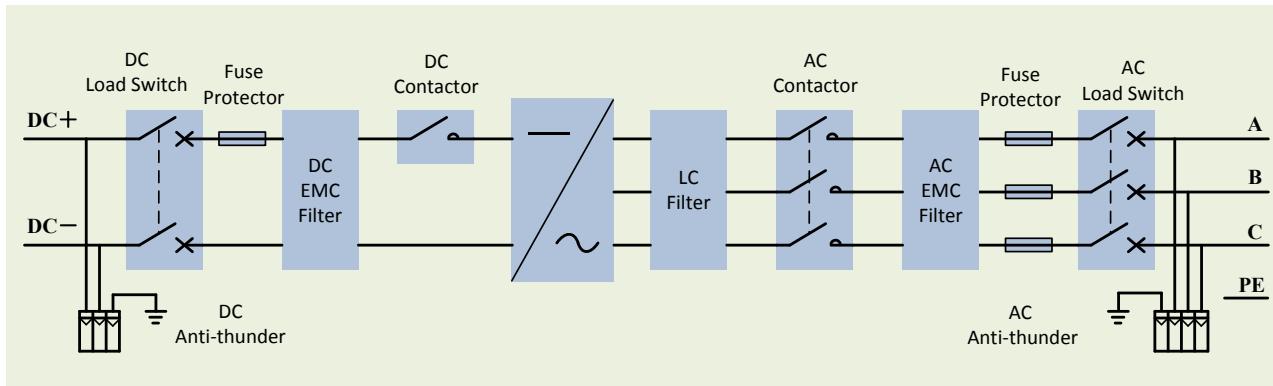

1MW PV inverter system takes 8 pieces of 125KW inverter modules in paralleled operation. The volume of modules depends on the valid solar energy collected from the solar PV battery panels. When in the morning, at dusk, at night, cloudy, overcast and other weather conditions, there is only some inverter modules to operate, 45% of loss per inverter module on average, it effectively prolong the service life of equipment and decrease the failure rate of device.

High redundancy design decreases the failure loss. In general condition, there is only 2% of the whole 8 inverter modules in full load operation in the whole year accumulated generation of 1MW inverter system. If one inverter module of 1MW inverter system breaks down or needs maintenance, the generation loss caused by is only 2%.
